Repository Link / File Path:

1. IDENTIFIED STRENGTHS

[1] RAII-style memory cleanup - ~DynamicArray() calls delete[] data automatically. [2] Safe dynamic resizing - resize() copies current elements, deletes the old buffer, then updates data and capacity.
[3] Bounds validation -removeItemAt() rejects negative and index >= size values.

2. IDENTIFIED WEAKNESSES / DEFECTS

[1] processMatrix() still demonstrates a fixed 3×3 matrix.
[2] The class uses a raw owning pointer rather than a standard container.
[3] Actual sanitizer/leak-detection evidence is not included in the source file.

3. RECOMMENDED ACTIONABLE IMPROVEMENTS

[1] Consider making the data structure generic with templates if required later. [2] Consider an explicit capacity-reduction strategy if unused capacity becomes a concern. [3] Keep const on read-only member functions and continue consistent naming.

DEVELOPER ACTION & REJECTION JUSTIFICATION

Recommendation [1]: ACCEPTED
Justification: It can make the system easier to improve in the future
Recommendation [2]: ACCEPTED
Justification: It can save memory. But it is not needed for this activity
Recommendation [3]: ACCEPTED
Justification: The code already uses const and consistent naming.
